

Load Development Preparation & Workflow Guide

Now that you have done everything contained in this document you can start using this load development tool as your assistant.

This guide describes every step that should be completed before any powder is placed into a cartridge, followed by the structured workflow for safe, repeatable, and professional load development.

1. Safety, Workspace & Documentation Setup

Reloading environment, personal safety, documentation preparation.

2. Rifle & Chamber Baseline

Confirm rifle configuration, clean barrel, verify zero.

3. Brass Preparation

Selection, depriming, cleaning, inspection, annealing, resizing, trimming, primer pocket prep, flash hole deburring, sorting.

4. Bullet Selection & Measurement

Select bullet, measure CBTO, determine seating depth reference.

5. Powder Selection

Choose powder, confirm data, establish charge range.

6. Primer Selection

Choose primer type, match to case, record lot.

7. Measurement & Tool Calibration

Scale, calipers, seating die, chronograph.

8. Load Development Strategy

OCW, Ladder, or Satterlee.

9. Workflow Summary

Prep brass, prime, charge, seat, label, record, shoot, analyze, tune, validate.

10. Cartridge Labeling & Tracking

Record all components and measurements.

11. Pressure Sign Awareness

Flattened primers, cratering, ejector marks, bolt lift, velocity spikes.

12. Final Pre-Loading Checklist

Verify all preparation steps.

13. When to Start Using the App Tool

After full prep and parameter definition.

14. Professional Recommendation

Precision is built before powder, primer, and bullet.

15. Disclaimer

Follow published data. Reloading involves risk.
