

Ladder Explained

What the Ladder Test Really Is

A ladder test is not about group size. It is a pressure vs velocity vs barrel timing diagnostic.

It shows where increasing powder stops moving vertical POI.

- Velocity increases
- Barrel time changes
- Barrel whip timing changes
- Bullet exits at different harmonic phase

How to Shoot a Proper Ladder

- Same brass, primer, seating depth
- 0.2–0.3 grain increments
- One round per charge
- Shoot low to high
- Cool barrel between shots

Reading Results

Ignore horizontal dispersion. Look only at vertical trends to find nodes.
