

Gunstuff Ballistics – User Manual

Introduction

Gunstuff Ballistics is a mobile load development and ballistic data management application designed for precision shooters and reloaders. It allows you to manage rifles, venues, sessions, and perform Ladder and OCW load development with integrated graphs, photos, and notes.

Main Sections

The application consists of the following main tabs:

- Rifles – Manage rifle profiles and barrel details
- Venues – Store shooting locations and conditions
- Session – Record shooting sessions
- Load Development – Ladder and OCW load testing
- History – Review completed sessions and results
- Tools – Ballistic utilities and wind tools

Rifles

Create and edit rifles by specifying caliber, barrel length, twist rate, and notes. Each rifle becomes available for sessions and load development projects.

Venues

Venues store distance, altitude, temperature, and environmental conditions. They help ensure your data is repeatable and context-aware.

Sessions

A session represents a shooting event. Required fields include distance, planned shots, and notes. The session can only be completed once all required fields are filled.

Load Development

Load development supports two workflows:

- Ladder testing – Evaluate velocity trends across charges
- OCW (Optimal Charge Weight) – Identify stable nodes

You can record charge weight, velocity shots, standard deviation, extreme spread, group size, and attach target photos.

Graphs and Results

Graphs visualize velocity, nodes, and shot distributions. Results can be collapsed or expanded independently from the graph display.

Photos and Notes

Each entry may contain a target photo and notes. Photos help visually confirm grouping and consistency.

Preferences

Preferences control units (metric/imperial), COAL/Ogive units, distance units, and interface behavior. Preferences are saved automatically when pressing Save.

Import and Export

You may export rifles, venues, sessions, and projects to files for backup or sharing. Imports merge only new records and display the number of items added.

PDF Export

Load development projects can be exported as PDFs including graphs and data tables for printing or sharing.

Best Practices

- Always confirm units before entering data
- Photograph targets immediately after shooting
- Use consistent chronograph placement
- Avoid editing completed sessions unless required
- Keep backups before major changes

Support

For issues, export your data and keep a backup before troubleshooting or upgrading the application.
